

ATTENTION COLORADO SPRINGS RESIDENT

Is it safe to drink directly from your tap or do you need a filter?

Colorado Springs Utilities ensures that the water meets all federal and state standards, making the use of a filter a matter of personal preference. To maintain water quality, the state-certified laboratory collects and analyzes over 12,000 samples each year, testing for contaminants such as viruses, bacteria, metals, pesticides, herbicides, PFAS, and more. In compliance with the Safe Drinking Water Act, the results of these tests are published in the publicly accessible water quality report.

What if a pipe bursts, a sink clogs, or a toilet backs up?

Quickly locate and shut off your home's main water valve to prevent further flooding damage. Then, contact a professional plumber to identify the source of the problem, diagnose the issue, and perform any necessary repairs. Be sure to take detailed photos for documentation when reporting the incident to your insurance company. If you are a renter, review your lease to determine who is responsible for plumbing repairs. Regularly inspect your home for leaks or potential plumbing issues, including frozen pipes. In older structures, allowing water to drip through the pipes can help prevent freezing.

What water issues are currently affecting our neighborhood?

Water conservation is crucial in Colorado Springs for several key reasons. Our semi-arid climate means we receive more rainfall than a desert but still face limited precipitation. As our community continues to grow, the demand for water increases, heightening the risk of scarcity. Additionally, we rely on imported water, making resource management even more critical. With variable snowfall that is often unpredictable, local water sources may not always provide a sufficient supply to meet the city's needs.

How can we conserve water in our community?

Colorado Springs actively participates in various community programs to conserve water. One example is the city's lawn watering restrictions, which limit watering to three times a week, only before 10 AM or after 6 PM. Residents are also encouraged to adopt simple water-saving habits, such as taking short showers instead of baths, running the dishwasher only with full loads, and turning off the tap while brushing their teeth.

Where is Colorado Springs' drinking water from?

Water from high-country snowmelt on the Continental Divide reaches us through a system of tunnels and pipes. Additionally, Colorado Springs receives water from reservoirs on the northern slope of Pikes Peak, the Pueblo Reservoir, and the Frying Pan River Basin, which feeds into the Arkansas River. After collection, the water undergoes treatment, testing, and continuous monitoring to ensure it meets drinking water standards.

Where can I learn more about subsidies or support for the water conservation?

The City of Colorado Springs provides a valuable resource at <https://www.csu.org/current-projects>, where updates on water and wastewater projects are available. Given the city's vast and scenic landscape, these projects span multiple locations. One major initiative is the Marksheffel Water Main Installation Project, which involves installing over 18,000 feet of water main between Peterson Space Force Base and Drennan Road. Another key project is on North Academy Boulevard, where water valve replacements are underway. This year marks the beginning of the project's third phase.
